

63k people had died within 7 weeks of receiving a Booster COVID Vaccine Dose in England between January & March 2022

Description

UK:  Print  PDF  Email

According to the UK Government institution, the Office for National Statistics (ONS), between January and March 2022, 62,801 people had sadly died within an average of 48 days after receiving a booster dose of the Covid-19 injection no later than 31st December 2021, and 4,781 of those deaths were attributed to Covid-19.

The Office for National Statistics (ONS) is the UK's largest independent producer of official statistics and the recognised national statistical institute of the UK.

On 8th September 2022, the ONS published an unnoticed dataset titled 'Characteristics associated with the risk of death involving coronavirus (COVID-19) among people receiving a booster vaccination, England: January to March 2022', which can be downloaded [here](#), and accessed on the ONS website [here](#).

Table 1 of the ONS dataset reveals that between January and March 2022, 62,801 people who had received a third dose of the Covid-19 injection by 31st December 2021 had sadly died.

Study population who had received three vaccination doses by 31 December 2022, England

Variable	Category	Total Population
All cause death		62801

The same dataset reveals that the average time between receiving a booster and the person losing their life was 48 days / 7 weeks.

The dataset does not reveal how these figures compare to the unvaccinated, but another dataset published by the ONS on July 6th 2022, does.

The dataset, which can be downloaded [here](#) and accessed on the ONS website [here](#), shows that between 1st January 2022 and 31st May 2022, the vaccinated population accounted for 9 in every 10 Covid-19 deaths, and 91% of those deaths were among the triple/quadruple vaccinated.

[Source](#)

That same dataset also reveals that by June 2022, 1 in every 73 Covid-19 vaccinated people in England had sadly died, compared to just 1 in every 172 not-vaccinated people.

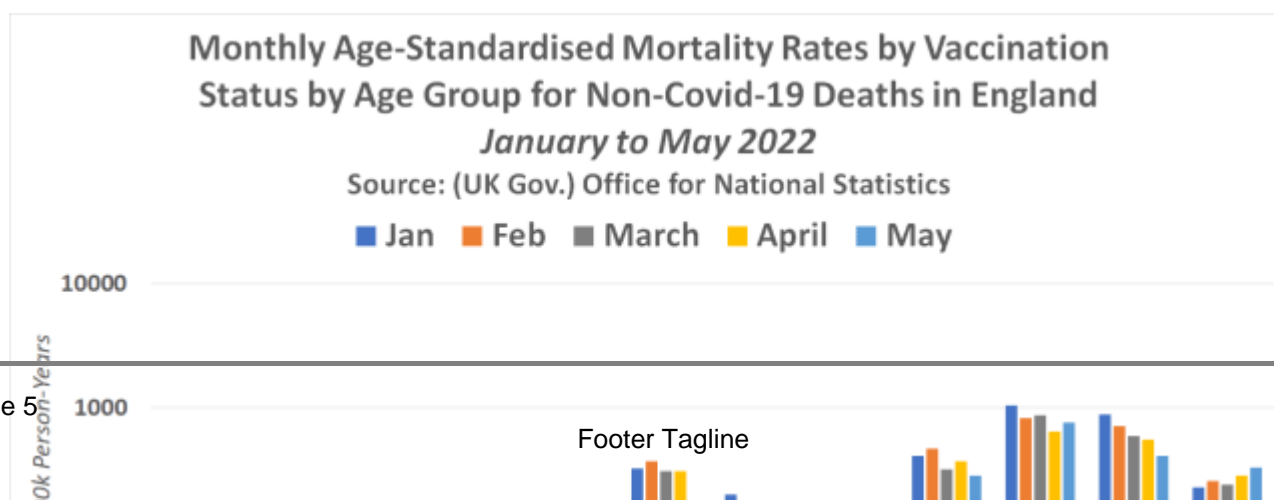

[Source](#)

These figures do not take into account other factors such as age, but this is still a considerable difference and is most definitely concerning when we look at the actual mortality rates per 100,000 by vaccination status and age group.

We can find those figures on table 2 of the [same ONS dataset](#) on deaths by vaccination status.

The following two charts show the monthly age-standardised mortality rates by vaccination status for non-Covid-19 deaths in England between January and May 2022 for each age group –

The official figures unfortunately confirm that mortality rates per 100,000 are the lowest among the unvaccinated population in every single age group in England. And the data reveals the gap between the unvaccinated and vaccinated populations in terms of mortality rates is widening by the month.

These are age-standardised figures. There is no other conclusion that can be found for the fact mortality rates per 100,000 are the lowest among the unvaccinated other than that the Covid-19 injections are killing people.

This is sadly why 63,000 people in England lost their lives between January and March 2022 within an average of 48 days of receiving a third dose of the Covid-19 injection.
