

‘A Variant Worse Than Delta’: Fauci Dials Fear To 11 As Emerging ‘Lambda’ Strain Appears More Resistant To Vaccine

Description

Dr. Anthony Fauci, the country’s top infectious disease specialist who funded controversial coronavirus research in Wuhan, China – and is now managing the coronavirus pandemic response for the US government, says the country could be “in trouble” unless everyone who hasn’t been vaccinated gets the jab.

“What we’re seeing, because of this increase in transmissibility, and because we have about 93 million people in this country who are eligible to get vaccinated who don’t get vaccinated — that you have a significant pool of vulnerable people,” said Fauci, who added that delta variant cases are rising in a “very steep fashion” and may hit 200,000 cases per day.

“And so when you look at the curve of acceleration of 7-day averages of cases per day, it is going up in a very steep fashion.”

No stats from Fauci on *who’s dying, who’s getting hospitalized, or who’s the most vaccine ‘hesitant’* of course.

The CDC reported today that only 28.4% of the black community have received the Covid vaccine. With states like CA and NY mandating vaccine passports to enter restaurants and businesses, the black community would be most affected by this modern day segregation

And while the Biden administration is now framing this as a “pandemic of the unvaccinated,” *McClatchy* notes that **“recent data shows that vaccinated people who still get infected with the delta variant also have high viral loads and can spread it to others**, even when they aren’t showing symptoms or are experiencing mild disease.”

*Fauci said that **data shows people infected with the delta variant have viral levels “about 1,000 times higher in quantity” than were recorded in people who were infected with the alpha variant**, also known as the U.K. variant, which earlier this year became predominant in the United States.*

Studies have emerged in recent weeks indicating that vaccinated individuals are at risk of “long COVID” — a series of conditions associated with infection such as fatigue, shortness of breath and loss of smell that can last for weeks or months — even if they are largely protected from severe illness and death, Fauci said.

“We already know that people who get breakthrough infections and don’t go on to get advanced disease requiring hospitalization, they too are susceptible to long COVID,” Fauci said. *“You’re not exempt from long COVID if you get a breakthrough infection.” -McClatchy*

Fauci also said he fears strains **which are even scarier than delta!**

“If we don’t crush the outbreak to the point of getting the overwhelming proportion of the population vaccinated, then what will happen is **the virus will continue to smolder through the fall into the winter, giving it ample chance to get a variant which, quite frankly, we’re very lucky that the vaccines that we have now do very well against the variants** — particularly against severe illness,” he said, adding “We’re very fortunate that that’s the case. **There could be a variant that’s lingering out there that can push aside delta.**”

“If another one comes along that has an equally high capability of transmitting but also is much more severe, then we could really be in trouble,” Fauci continued. “People who are not getting vaccinated mistakenly think it’s only about them. But it isn’t. It’s about everybody else, also.”

Lambda evading vaccine?

While the highly infectious Lambda variant of Covid-19 may or may not be deadlier than any of the other strains – meaning the vast majority who contract it won't be hospitalized or die – **researchers at the University of Tokyo have warned in [a new study](#) that it may be vaccine-resistant**, according to [Newsweek](#).

*Like the [Delta variant](#), Lambda is highly transmissible but Japanese researchers believe that **three mutations in the variant's spike proteins make it more resistant to antibodies [induced by vaccination](#)**.*

Lambda, which is also known as the C.37 variant, is responsible for 1,037 cases of COVID-19 in the U.S., according to data from the GISAID Initiative, which promotes the rapid sharing of information about influenza and coronaviruses.

The variant was first identified in Peru in August, 2020, where it [has now become the dominant strain](#) of the virus, and it has been reported in 29 countries including the U.S. -
Newsweek

“...because the Lambda variant is relatively resistant to the vaccine-induced antisera, it might be possible that this variant is feasible to cause breakthrough infection,” reads the paper, with “Vaccine-induced antisera” referring to antibodies which arise from vaccination.

There MAY be an Omega Death Variant coming if we don't lock down and wear masks forever and get vaccinated and get 15 booster shots and never go outside but maybe not still let's be on the safe side and do all of it anyway even if it destroys the country.

Am I doing this right?
