

Arctic Sea Ice is Now Just 3% Below Its 30 Year Average

Description

According to the latest report from the EU's Earth observation programme, Arctic sea ice is just 3 per cent below its 30 year average.

Whoops, narrative fail!

The Daily Sceptic's environmental editor Chris Morrison [explains](#) the data.

The red line on the graph on the left plots the 2021 record and it can be seen that it is an improvement on recent years. Deviations from the average in March and September shown on the right have both eased in recent years. Of course in historical and geological terms these changes are insignificant, but they are likely to put a dampener on the generally hysterical tone about polar weather encountered in most climate change debate. This tone was set back in 2009 when former US vice president Al Gore reported there was a high chance that the North Pole would be summer ice free by 2013. So far as climate catastrophism is concerned, the Arctic is the gift that keeps on giving. Discussing a crackpot scheme to 'save the Arctic ice' by sprinkling it with glass, the BBC Future Planet site noted in 2020 that the area was in a "self-destructive feedback loop". Much of the ice was said to be "rapidly vanishing".

Morrison goes on to document how Arctic sea ice has grown and abated for hundreds of years of historical records and well before man started emitting carbon dioxide to any significant degree.

As we [highlighted](#) last year, one of the authors of the United Nations IPCC report who focused on "extreme" consequences of man-made global warming lauded the fact that "people are starting to get scared" about climate change and that this would "affect the way they vote."

However, doomsday climate change prophecies have been proven spectacularly wrong time and time again.

According to a much heralded [2004 report](#), man-made climate change would cause “millions” of deaths, major European cities being sunken, nuclear war and global environmental riots...all by 2020.

It never happened.

As we highlighted back in January 2020, Montana’s Glacier National Park was [forced to remove](#) all signs that read “glaciers will all be gone by 2020,” after the doomsday scenario didn’t happen.

So-called “climate experts” have got it wrong time and time again on absolutely everything, from Paul Ehrlich’s prediction of millions of deaths from famine by the 80’s, to Al Gore’s absurd claim that the Arctic would have “ice free” summers by 2013.

At the end of the 70’s, climate experts said that a [new ice age](#) was coming. It didn’t happen.

None of it ever happens, yet the same “experts” are still given platforms and vast funding to insist we reduce our living standards, while voices of dissent are silenced by government decree, Big Tech censorship and social media algorithms.
