

## CDC Begins Mass Extermination Program of Americans' Children Aged 12 to 17 Implementing Eugenic Population Control Measures through COVID-19 Bioweapons

### Description

Rochelle Walensky, the current director of the criminal organization and marketing arm of the pharmaceutical industry, the CDC, which should be renamed more appropriately as the **C**enter for **D**EATH and population **C**ontrol, has committed crimes against humanity by heading up a program to kill, maim, and render infertile Americans' children between the ages of 12 and 17.

In spite of the overwhelming evidence that this age group has nearly ZERO risk for harm from COVID-19, she addressed the public yesterday and lied to the American people.

Dr. Walensky revealed that the United States continues to make progress in ending the pandemic, with the seven-day average of daily deaths at a new low of 363 per day, "a decrease of more than 16% from the last week as the administration kicks off its national month of action," she said.

In addition to reaching the 70 percent goal, there is a new group of people who need to start lining up for their shots: teens. "In the critical month of June, I want to highlight a specific population that we were hoping will join the tens of millions who have already been vaccinated, and that is adolescents," she explained.

She also referenced a report to be published in Friday's *Morbidity and Mortality Weekly Report*, that demonstrates "the level of severe disease, even among youth that are preventable," which is why the CDC is going to "redouble" motivation to get adolescents and young adults vaccinated. ([Source](#).)

The propaganda report promised yesterday is now up on the CDC website today, and [you can read it here](#).

Here are some excerpts from this "study" that is supposed to justify injecting millions of children with

the COVID-19 bioweapon shot:

## **Summary**

### **What is already known about this topic?**

Most COVID-19–associated hospitalizations occur in adults, but severe disease occurs in all age groups, including adolescents aged 12–17 years.

### **What is added by this report?**

COVID-19 adolescent hospitalization rates from COVID-NET peaked at 2.1 per 100,000 in early January 2021, declined to 0.6 in mid-March, and rose to 1.3 in April. Among hospitalized adolescents, nearly one third required intensive care unit admission, and 5% required invasive mechanical ventilation; no associated deaths occurred.

### **What are the implications for public health practice?**

Recent increased hospitalization rates in spring 2021 and potential for severe disease reinforce the importance of continued COVID-19 prevention measures, including vaccination and correct and consistent mask wearing among persons not fully vaccinated or when required.

Understanding and describing the epidemiology of COVID-19–associated hospitalizations in adolescents and comparing it with adolescent hospitalizations associated with other vaccine-preventable respiratory viruses, such as influenza, offers evidence of the benefits of expanding the recommended age range for vaccination and provides a baseline and context from which to assess vaccination impact.

Using the Coronavirus Disease 2019–Associated Hospitalization Surveillance Network (COVID-NET), CDC examined COVID-19–associated hospitalizations among adolescents aged 12–17 years, including demographic and clinical characteristics of adolescents admitted during January 1–March 31, 2021, and hospitalization rates (hospitalizations per 100,000 persons) among adolescents during March 1, 2020–April 24, 2021.

Among 204 adolescents who were likely hospitalized primarily for COVID-19 during January 1–March 31, 2021, 31.4% were admitted to an intensive care unit (ICU), and 4.9% required invasive mechanical ventilation; there were no associated deaths. During March 1, 2020–April 24, 2021, weekly adolescent hospitalization rates peaked at 2.1 per 100,000 in early January 2021, declined to 0.6 in mid-March, and then rose to 1.3 in April.

Cumulative COVID-19–associated hospitalization rates during October 1, 2020–April 24, 2021, were 2.5–3.0 times higher than were influenza-associated hospitalization rates from three recent influenza seasons (2017–18, 2018–19, and 2019–20) obtained from the Influenza Hospitalization Surveillance Network (FluSurv-NET).

Recent increased COVID-19–associated hospitalization rates in March and April 2021 and

the potential for severe disease in adolescents reinforce the importance of continued COVID-19 prevention measures, including vaccination and correct and consistent wearing of masks by persons not yet fully vaccinated or when required by laws, rules, or regulations. ([Source.](#))

Anybody with at least a high school education reading level can clearly see through the BS in this “study” which is nothing more than propaganda. But how many parents will even bother reading this garbage before deciding to let someone inject their child with a COVID-19 bioweapon?

First of all, this “study” is based on only 204 teenagers, and they are using it as a basis for mass injections for this age group!

And among those 204 teenagers they looked at, they could not even find one single death in the group! And there is no way to even know from among these 204 children they looked at, whether they actually had COVID-19 (remember the PCR test is faulty to begin with), or even if they did, whether it caused any illness, and they had to admit that by saying:

Among 376 adolescents hospitalized during January 1–March 31, 2021, who received a positive SARS-CoV-2 laboratory test result, 172 (45.7%) were analyzed separately because their primary reason for admission might not have been directly COVID-19–related.

They use the word “likely” throughout the “study.”

The CDC has a long history of corruption, and they have proven over and over again that we cannot trust ANYTHING they say or publish.

Even this week they withheld data on COVID-19 “vaccine” deaths reported to the VAERS system. Every week for the past several months they have updated that number on their *Selected Adverse Events Reported after COVID-19 Vaccination* [page here](#).

But for the first time, not this week. It still shows the total of 4,863 deaths reported through last week. This total has always been a couple of hundred more than what they release in their weekly data dumps on Friday into VAERS.

That data dump today had a huge increase in deaths, from 4,406 last week, to 5,165 today. That’s an increase of reported deaths of 759 over last week.

But guess which age group had NO increase in deaths according to the CDC? You got it, 12 to 17-year-olds. That total remains at 4 deaths, even though we know that hundreds of thousands of teens in that age group have now been injected.

So now the CDC will use this “data” to try and convince millions of parents to allow their children to be injected with these bioweapons, except in dozens of locations around the U.S. where local health authorities are allowing children as young as 12 years old to make that decision for themselves, without the knowledge and consent of their parents.

We are seeing a global eugenics population reduction plan being unfolded before our very eyes that now far eclipses anything that happened in Nazi Germany during WWII, and is now racing ahead

towards numbers that were reported during the Bolshevik revolution under Lenin and Stalin.

## **Where is the Outrage in the United States for this Act of Genocide Against our Children?!**

I am not seeing it. Only a group of outraged parents in Canada, where the same thing is happening, have so far taken to the streets to protect their children.
