Governments worldwide are working in Lockstep to bring in Digital I.D. & Social Credit System as EU agrees to expand online censorship with 'Digital Services Act'

Description

 Print  PDF  Email

USA/EU: Under pressure applied by both Hillary Clinton and Barack Obama, the European Union is working to expand online censorship to an extreme Orwellian level, as well as strictly regulate speech during what authorities deem to be times of crisis (*we always seem to be in the middle of a "crisis"*), and remove online anonymity by forcing the public to have a digital identity.

But these plans aren't unique to the EU. They are also currently being rolled out in the UK and Africa, proving Governments worldwide are working in lockstep to bring in a digital identity and social credit system right under your nose.

Image not found or type unknown

Hillary Clinton and Barack Obama both lobbied for the EU to back the censorship bill known as the ‘[Digital Services Act](#)’ on Thursday, April 21st, 2022:

From [France 24, “EU agrees on new legislation to tame internet ‘Wild West’”](#):

The Digital Services Act (DSA) — the second part of a massive project to regulate tech companies — aims to ensure tougher consequences for platforms and websites that host a long list of banned content ranging from hate speech to disinformation and child sexual abuse images.

[...] Tech giants have been repeatedly called out for failing to police their platforms — a New Zealand terrorist attack that was live-streamed on Facebook in 2019 caused global outrage, and the chaotic insurrection in the US last year was promoted online.

The dark side of the internet also includes e-commerce platforms filled with counterfeit or defective products.

[...] The regulation will require platforms to swiftly remove illegal content as soon as they are aware of its existence. Social networks would have to suspend users who frequently breach the law.

The DSA will force e-commerce sites to verify the identity of suppliers before proposing their products.

[...] The European Commission will oversee yearly audits [of Big Tech firms] and be able to impose fines of up to six percent of their annual sales for repeated infringements.

Looking over [the outline of the new agreement](#) it's striking how they seamlessly conflate child sexual abuse material with "illegal hate speech."

Both are jumbled together as "illegal content."

The law calls for plans to restrict free speech on the internet during times of "crisis."

Image not found or type unknown

The DSA also [pushes for](#) a “public electronic identity (eID),” which [Politico previously described as a “National ID card” on your phone](#) that has its origins in vaccine passports and “Digital COVID Certificates.”

Image not found or type unknown

Though the eID is sold under the guise of protecting people’s privacy, “digital rights activists ... worry the proposal could allow the private sector to better access people’s government-certified information, thereby actually strengthening the likes of Facebook and Google and the targeted advertising industry,” Politico reported.

Working in Lockstep

The UK government is also pushing ahead with its nationwide digital ID plans, despite half of the responses to its public consultation on digital identity opposing the idea.

On April 6, 2022, [new digital identity document verification technology \(IDVT\)](#) that enables data sharing between public bodies and businesses for the purpose of identity verification was introduced. It has been made available to UK employers, landlords, and letting agents who can use it to digitally carry out pre-employment criminal record checks, right to work checks, and right to rent checks.

[Source](#)

The introduction of this digital IDVT is part of the government's [far-reaching digital ID plans](#) which were announced in March. The government has framed these digital ID plans as a way for UK citizens to “easily and quickly prove their identity using digital methods instead of having to rely on traditional physical documents.”

Before announcing these digital ID plans, the government sought views and feedback on its proposed approach to digital identity via a public consultation.

50% of the responses to this consultation were “against digital identity in principle” but the government didn't include these responses in its statistical analysis of responses to the consultation because they “did not engage with the questions.” However, the government insisted that “outside the context of producing the statistical analysis, we have taken these responses into account as part of this consultation exercise.”

The government's digital ID plans were announced in the same month that the UK government's Online Safety Bill began its legislative journey. This bill mandates the implementation of identity and age verification technology on many large online platforms.

The UK Government and Bank of England have also been working on a new digital currency in the background to replace cash.

Image not found or type unknown

Under [the plan pushed by the Chancellor Rishi Sunak](#), cash in people's pockets would be superseded by a new 'Bitcoin' digital currency. It is being framed as "giving the economy a boost in times of financial crisis". We hope you're not that naïve.

But the Bank of England and the Government are also questioning [how to impose limits on spending digital currency](#). This could include "restrictions on types of users able to transact in new forms of digital money".

The UK Government has been working in tandem with other world leaders and the EU to introduce a social credit system and digital identity right under your nose.

In January 2022 the Department of Health and Social Care, currently led by Sajid Javid, [launched a new app that allegedly "helps people to make positive changes to their diet and physical activity."](#)

The pilot scheme has seen users wear wrist-worn devices that can generate personalised health recommendations, such as increasing their step count, eating more fruit and vegetables, and decreasing portion sizes.

Users allegedly collect points for behaviours deemed healthy by the Government, which unlock "rewards". The Government says these rewards include "gym passes, clothes or food vouchers, discounts for shops, and cinema or theme park tickets".

Now Italy is about to launch the same scheme.

On 28 March Matteo Lepore, Mayor of Bologna, and Massimo Bugani, councillor for the digital agenda and civic use of data, announced the City's digital innovation plan 2022-2024.

"We will start with a pilot project for the city: at the center is the virtuous citizen, the one who, for example, separates waste well or does not waste energy, or uses public transport and does not take fines, or is still active with the Bologna Welcome Card. The Municipality

says to these people ‘we will assign you a score’, as part of a circular reward with economic benefits to individual users.”

The program will kick off its pilot starting in the autumn of 2022 in Bologna. Citizens who comply with the radical climate change agenda by displaying “good behaviour,” such as correctly recycling or using public transportation, will be rewarded with cryptocurrency and discounts to local retailers, according to local newspaper *Bologna Today*.

Even Nigeria is now in on the act after being targeted by Bill Gates’ GAVI in 2020 to introduce a “biometric identity platform.”

Nigeria’s federal government has ordered telecommunication companies to bar calls from phone numbers not yet linked to a National Identity Number. They have also ordered unregistered SIM cards to be disconnected.

In December 2020, President Muhammadu Buhari ordered all phone lines to be linked to an identification number. This was done under the guise of “curbing rising incidents of abductions in the country’s northern region”.

Based on the inability of subscribers to meet the 31 December 2020 deadline, the government had to postpone the deadline for the tenth time.

The government has said that the 11-digit identification number is the foundation for a comprehensive digital ID system that will help to tackle insurgency by militants such as Boko Haram – as well as other crimes.

National Identity Number registration involves the recording of an individual’s demographic data and capturing their fingerprints, photo, and digital signature. The number is required for all transactions requiring identity verification, such as opening a bank account, applying for a driver’s licence, voting, obtaining health insurance, and filing tax returns.

This is in essence a war, and many of you may not even realise you are in it. All the evidence is there, it just needs piecing together. There is a coordinated effort worldwide to bring in a digital identity and social credit system right under your nose.
