

Heart Inflammation, Blood Clots & Other Dangerous Side Effects Occur From COVID-19 Vaccine, Says Study

Description

Experimental mRNA injections that use the COVID spike protein present severe cardiovascular health risks, according to peer-reviewed studies.

“On Point” host Alex Pierson talks with Dr. Byram Bridle, an Associate Professor on Viral Immunology at the University of Guelph about new peer-reviewed studies that suggest there may be terrifying reasons side effects such as heart inflammation, VITT, and other serious issues may occur in those who have received the COVID-19 shot.

“What has been discovered by the scientific community is the spike protein on its own is almost entirely responsible for the damage to the cardiovascular system if it gets into circulation,” Bridle said.

“Indeed, if you inject the purified spike protein into the blood of research animals, they get all kinds of damage to the cardiovascular system and it can cross the blood-brain barrier and cause damage to the brain,” he added.
