

Latest Vaccine Studies Shocked Doctors Calling For It To Be Pulled From Shelves Before It Kills Too Many People!

Description

USA: We are clear that vaccines are meant to kill millions of people.

Everyone has realized that the Pfizer shot is ineffective in children from five to eleven, according to the new batch of trial data shared by the vaccine giant.

Owen Shroyer hosted The Alex Jones Show to discuss the latest revelations.

One preprint report utilizing an NYS database of children aged 5-17 analyzed the effectiveness of the Pfizer vaccine.

The researchers exposed the mRNA shot's efficacy against the virus cases and hospitalizations for the age demographics during December 2021 and January 2022.

The Abstract shared: *"In the Omicron era, the effectiveness against cases of BNT162b2 declined rapidly for children, particularly those 5-11 years."*

A few weeks after becoming "fully vaccinated," the Pfizer shot's efficacy waned for children.

From 5-11-year-olds, the mRNA shot crossed a threshold of negative vaccine efficacy five weeks after becoming fully vaccinated. By the sixth week, these children were 40% more likely to contract C-19 than their unvaccinated peers.
