

Pfizer Injection Victim Speaks Out

Description

In the video above, Peters interviews Stevie Thrasher, a previously healthy 29-year-old in Washington state who got her first Pfizer shot April 27, 2021. Since then, she's been hospitalized nine times, and her doctor has confirmed her injuries are a direct result of the Pfizer mRNA injection. Her neurologist has told her not to get a second dose.

One of her first symptoms was severe menstrual bleeding. After that, she started experiencing severe body pains, muscle weakness and muscle failure, fatigue, dizziness and disorientation. Since her shot, she's been in the hospital nine times, had three neurological evaluations and received referrals to rheumatologists and immunologists.

Remarkably, despite the severity of her symptoms, all tests, including imaging and blood work, appear normal, with the exception of an ANA blood test (a test that detects antinuclear [antibodies](#) that can attack your own tissues) indicating she might have an autoimmune condition, although it's unclear which one.

Her doctors have thus far been unable to explain why her test results are all normal while she's clearly experiencing symptoms of disease, and all she's been diagnosed with so far is "adverse reaction to [Pfizer COVID vaccine](#) with myalgias." As you can see in the video above, she has involuntary tremors. She says they come and go depending on circumstances. Triggers include sunlight, heat, elevation, stress and physical activity.

While Thrasher was warned of the possibility of blood clots and anaphylactic reactions, she was not informed there may be neurological and autoimmune side effects. "If I had known this was a possibility, I would have turned around and ran," she tells Peters.

Unvaccinated Falsely Accused of Being 'Disease Factories'

Adding insult to injury, mainstream media are now pushing the idea that those who refuse the COVID shot are to blame for the emergence of SARS-CoV-2 variants, even though a number of health experts have warned that it's the complete opposite — that mass injections, causing a very narrow band of antibodies, are forcing more rapid mutations of the virus.⁹

It's a general principle in biology, vaccinology and microbiology, that if you put living organisms like bacteria or viruses under pressure, via antibiotics or antibodies, for example, but don't kill them off completely, you can inadvertently encourage their mutation into more virulent strains. Those that escape your immune system end up surviving and selecting mutations to ensure their further survival.

If an individual who does not have a narrow band of antibodies becomes infected, then, if mutation does occur, it's far less likely to result in a more aggressive virus. So, while mutation can occur in both vaccinated and unvaccinated people, vaccinated individuals are actually far more likely to pressure the virus into a mutation that strengthens it and makes it more dangerous. Alas, according to CNN:¹⁰

“Unvaccinated people do more than merely risk their own health. They're also a risk to everyone if they become infected with coronavirus, infectious disease specialists say. That's because the only source of new coronavirus variants is the body of an infected person.

‘Unvaccinated people are potential variant factories,’ Dr. William Schaffner, a professor in the Division of Infectious Diseases at Vanderbilt University Medical Center, told CNN ... ‘The more unvaccinated people there are, the more opportunities for the virus to multiply,’ Schaffner said.”

What Schaffner and CNN fail to address is the confirmed fact that the COVID shot does not provide immune protection against a SARS-CoV-2 infection. So those who have gotten the injection can also become hosts to the virus, just like those who have haven't been scammed into taking the COVID jab.

There's absolutely no medical justification for singling out unvaccinated people as the sole disease vectors, or the sole vectors for mutation. [Breakthrough cases](#) in fully “vaccinated” people prove this point. Unfortunately, vaccinated individuals are not informed about the potential that they might experience antibody-dependent enhancement (ADE) or paradoxical immune enhancement (PIE), which may actually render them more susceptible to infection by variants.¹¹

If that turns out to be the case, and there are already indicators suggesting this is happening,^{12,13,14,15,16,17} then vaccinating even more people is not the answer. Unvaccinated individuals cannot be held responsible for what happens to those who volunteered to take part in this mass experiment, or be asked to “save” those people by putting their own health at risk.

Control Groups Destroyed on Purpose

Disturbingly, all the evidence points to vaccine makers and health agencies not wanting to identify problems with these shots. Despite this being the largest medical experiment in human history, vaccine makers are purposely eliminating their control groups so that injuries will be far more difficult to ascertain, since they won't have anything to compare the vaccine recipients against.

In a JAMA report,¹⁸ Rita Rubin, senior writer for JAMA medical news and perspectives, quotes the chief scientific adviser for Operation Warp Speed, Moncref Slaoui, Ph.D., saying he thinks "it's very important that we unblind the trial at once and offer the placebo group vaccines" because trial participants "should be rewarded" for their participation.

Such statements violate the very basics of what a safety trial needs, which is a control group against which you can compare the effects of the drug in question over the long term. I find it inconceivable that unblinding was even considered, seeing how the core studies have not even concluded yet, and some standard safety studies have been bypassed entirely.

For example, Pfizer has not conducted any reproductive toxicology studies despite finding the mRNA and spike protein accumulates in the ovaries. The only purpose of this unblinding is to conceal the fact that these injections are unsafe. Safety evaluations have also been undermined by the U.S. Food and Drug Administration, which chose not to require vaccine makers to implement robust post-injection data collection and follow-up on the general public.

What Is the Mass Injection Campaign Really All About?

It's obvious the COVID injection manufacturers intentionally removed every safety monitoring control because they wanted to obfuscate the anticipated complications that were certain to occur. They wanted to prevent as many complications as possible from surfacing. Safety is clearly not something they are concerned about.

Think about it: If the vaccination campaign were about creating a high rate of immunity within the population, they would accept natural immunity to COVID as an alternative to the jab. But they don't. Even if you can prove you have high levels of antibodies from natural infection, you still must get the COVID shot if you want to attend school or keep your job in some areas, and natural immunity does not count if you want a COVID immunity passport.

This means the injections are NOT about creating herd immunity. They want a needle in every arm for some other reason. What do you think that reason might be? Many who have pondered this question have reached the conclusion that whatever the reason might be, it's a nefarious one.

At a minimum, this campaign is about getting a needle in every arm to maximize their profits. At its extreme worst, it could be part of a cleverly constructed depopulation strategy.

Michael Yeadon, Ph.D., a life science researcher and former vice-president and chief scientist of allergy and respiratory research at Pfizer, has gone on record saying he believes the COVID-19 injections, and the upcoming boosters in particular, are a "serious attempt at mass depopulation."¹⁹

In my view, there are still so many potential avenues of harm and so many uncertainties, I would encourage everyone to do your homework, keep reading and learning, weigh the potential pros and

cons, and take your time when deciding whether to get any of these COVID-19 gene therapies. If you have already had one, think long and hard before getting any boosters.
