

RADIOACTIVE PANIC: Russians Missiles Hit Ukrainian Ammunition Depot in Khmelnytsky Causing Massive Explosion – Cache of British Depleted Uranium Tank Shells Destroyed – Gamma Radiation Spikes in the Region’s Atmosphere

Description

UKRAINE: The West’s proxy war against Russia in the Ukraine has led to progressively more deadly weapons systems and ammunition to be delivered to Zelensky’s Nazi regime.

Possibly, the most controversial of these deliveries are the deadly radioactive shells for Challenger 2 tanks that the British government has given Ukraine.

Robert F. Kennedy Jr commented on Instagram:

“In another reckless escalation, Britain has confirmed delivery of depleted uranium munitions to Ukraine. DU munitions should be banned. They partially vaporize on impact, poisoning the environment with uranium dust that causes cancer and horrific birth defects.”

On Saturday, during a massive air and missile raid on Ukraine, Russian forces hit a ammunition depot in Khmelnytsky, in the western part of the country, causing gigantic explosions in the site.

Intel Slava reported:

“It is worth noting that panic reports are spreading in Ukrainian social networks that during the detonation of an ammunition depot in Khmelnytsky, a large batch of British tank ammunition with depleted uranium, which was recently brought to Ukraine along with Storm Shadow missiles, was also destroyed. As a result of a huge explosion, particles of depleted uranium could be dispersed on the territory of the Khmelnytsky region, which, taking into account the experience of Yugoslavia and Iraq, could lead to an outbreak of cancer in the medium term.”

It didn't take long for the results of the impact to be measurable scientifically.

Khmelnitskyi

Daily Average Gamma Dose Rate

Slavyangrad [on Telegram](#):

“A clear spike in gamma radiation was detected in Khmelnytsky on or about May 12th, with emission continuing to rise the following day and remaining at the elevated level thereafter.

Considering how little gamma radiation comes from depleted uranium, this clear spike in gamma radiation in Khmelnytsky indicates that there was very large stockpile of the DU munitions that was destroyed, raising the uranium dust into the air.

By comparison, the towns of Ternopol, Khmilnik, and Novaya Ushitsa remained at their apparent regular, base levels. This indicates that the Khmelnytsky anomaly is indeed a spike and corroborates the claim that the stockpile in Khmelnytsky contained DU munitions.”

While the UK authorities dismissed the danger posed by this kinds of shells, the experience in Yugoslavia and Iraq has shown how deadly in the medium term these vaporized depleted uranium shells can be.
