

The Latest Unredacted Document Released Proves How Pfizer & FDA Knew About Antibody-Dependent Enhancement (ADE)

Description

The FDA released the latest batch of internal Pfizer COVID-19 jab documents under court order.

And, as usually, the broader public hasn't heard a peep from the mainstream media about the latest revelations from the unredacted documents.

The trove of 11,000+ pages of documents, released on April 1st, reveal Pfizer and the FDA knew about vaccine-induced ADE and colluded to cover it up by claiming "no new safety issues have been raised."

[Pfizer Documents](#)

"An investigation of official Government data has uncovered that fully vaccinated individuals are up to 3 times more likely to be infected with Covid-19, 2 times more likely to be hospitalised with Covid-19, and 3 times more likely to die of Covid-19 than unvaccinated individuals," The Daily Expose added in their report.

The question is, why?

"One possibility is that as feared, the vaccinated are suffering Vaccine-Associated Enhanced Disease leading to conditions such as antibody-dependent enhancement, and cytokine storm. In effect, this means the Covid-19 injections cause a vaccinated person's immune system to go into overdrive when they come into contact with the virus, causing harm to the person and worsening disease.

But it turns out this possibility could actually be reality. Because the latest round of confidential Pfizer documents published 1st April 22, confirm that both Pfizer and the FDA knew Vaccine-Associated Enhanced Disease was a possible consequence of the mRNA Covid-19 injections, and they received

evidence of it occurring, including several deaths, but swept it under the carpet and claimed “no new safety issues have been raised.”

This may explain why Pfizer and the FDA wanted to hide the internal COVID-19 jab data for 75 years.
