

The Rude Awakening with Judy A. Mikovits, PHD

Description

“The US Centers for Disease Control and Prevention has stayed true to form by deciding that its current mask guidance – not to be confused with its previous and repeatedly revised guidance – needs to be reversed. Again. It’s a shame so many Americans do not appreciate the new rules concerning the use of face coverings among the fully vaccinated. After all, asking jabbed citizens to mask up after telling them they don’t need to mask up, after suggesting to them that wearing two masks almost all the time would be even better, must be the best possible and most consistent public health policy under the current circumstances. What is the world is going on and where is everything headed?” (citation: Riley Waggaman)

Making her second appearance on the Outer Limits of Inner Truth is Dr. Judy Mikovits – a modern-day Rosalind Franklin, a brilliant researcher shaking up the old boys’ club of science with her ground-breaking discoveries. And like many women who have trespassed into the world of men, she uncovered decades old secrets that many would prefer to stay buried.

JUDY A. MIKOVITS, PHD

Dr. Judy A. Mikovits earned her BA in chemistry with a specialization in biology from the University of Virginia in 1980 and her PhD in biochemistry and molecular biology from George Washington University in 1992. In her 35-year quest to understand and treat chronic diseases, she has co-authored seminal papers culminating at least a decade of research in each of four fields: immunology, natural products chemistry, epigenetics, and HIV/AIDs drug development. In 2006, she became attracted to the plight of families with neuroimmune diseases including ME/CFS and autism. Dr. Mikovits has been primarily responsible for demonstrating the relationship between environmentally acquired immune dysfunction, chronic inflammation, and these diseases.

Dr. Mikovits has published more than 50 peer-reviewed articles, many in the world’s top medical journals and she has been profiled in Discover magazine as well as the Wall Street Journal and The New York Times. Her pioneering work during her 20-year career at the National Cancer Institute includes the discovery of the modulation of DNA methylation machinery by human retro viral infection

and the development of the concept of inflammatory cytokines and chemokine signatures of infection and disease, which was first published in 1999, when she directed the Laboratory of Antiviral Drug Mechanisms in developing therapeutics and diagnostics for HIV/AIDS and AIDS associated malignancies.

These are all therapies that are still the standard of care twenty-five years later and credited with saving millions of deaths from HIV/AIDS.
