

“Turbo Cancer” Post COVID-19 Vaccination? 21-Year Old Evan Fishel Died of Leukemia Only Four Days After Diagnosis.

Description

As an Oncologist, I diagnosed 10,000s of Canadian cancer patients and treated 100s with Targeted Radionuclide Therapy. I have seen many horrific things during my career. But I have never seen a rapid progression like this.

21 year old California University student Evan Fishel was graduating from Cal Maritime Academy and was accepted to Berkeley Law School. He died on Feb.10, 2023, 4 days after being diagnosed with Leukemia ([click here](#)).

Evan Fishel, Celebration of Life & Expenses Fund

Shawna Saari is organizing this fundraiser on behalf of Suzyn Card.

Created 7 days ago • [Funerals & Memorials](#)

On February 10th, our much loved Evan Fishel passed away after a short battle with Leukemia that had only been diagnosed 4 days prior. We want to help his mother, Suzyn Card, navigate expenses related to his sudden passing. This is devastating to us all, as Evan was only 21 and had a bright future ahead. He was graduating from Cal Maritime Academy this June and had been accepted to Berkeley Law School in the Fall. He was a valuable part

His University, Cal Maritime Academy had a COVID-19 vaccine mandate and to this day, recommends COVID-19 booster shots based on CDC guidelines ([click here](#)).

I never liked the term “turbo cancer”. It doesn’t sound very scientific. However, it is a term that has caught on and is now recognized as a frightening phenomenon following COVID-19 vaccination.

In November 2021, a small paper was published by Goldman et al: “Rapid Progression of Angioimmunoblastic T Cell Lymphoma Following Pfizer mRNA vaccine booster shot” ([click here](#)).

This image will be familiar to many:

[Figure 1](#)

Maximum-intensity-projection images of ^{18}F -FDG PET/CT at baseline (8 Sept) and 22 days later (30 Sept), 8 days after BNT162b2 mRNA vaccine injection in right deltoid. 8 Sept: hypermetabolic lymph nodes mainly in the supra-

I performed thousands of PET/CT scans like this in Edmonton, Alberta with radio-labeled glucose, to diagnose cancer patients. Other than the normal brain, heart and radioactive urine in the bladder, the rest of the black dots are cancer-filled lymph nodes in the neck, axillae and iliac regions.

This was a 66 yo man who had 2 Pfizer COVID-19 mRNA vaccines and developed an aggressive lymphoma 6 months later (left image). In preparation for chemotherapy, doctors gave him a Pfizer COVID-19 mRNA booster shot (!!!). Within a few days, the patient reported “considerable swelling of neck lymph nodes”. Fortunately, his doctors wanted another PET/CT scan to have a more precise baseline scan before his chemotherapy, so they did one **8 days after the COVID-19 booster shot**.

In the image on the right, the cancer effectively exploded all over the body, growing and spreading to new groups of lymph nodes in new locations. The authors themselves noted just how abnormal this was:

“First, the dramatic speed and magnitude of the progression manifested on two 18F-FDG PET-CT performed 22 days apart. Such a rapid evolution would be highly unexpected in the natural course in the disease.”

“this is the first observation suggesting that administration of a SARS-CoV-2 vaccine might induce AITL (lymphoma) progression”

This was the first time that “turbo cancer” following COVID-19 vaccination was caught on a PET/CT scan, and it was purely by chance.

There was another small study by Zamfir et al. reporting two cases of aggressive lymphoma that developed **within a week following Pfizer COVID-19 mRNA**vaccination ([click here](#)). This study includes some gruesome pictures of these rapidly progressing cancers.

No one has been able to properly explain these cases. One US surgical oncologist wrote a long article in Dec.2022 claiming that “turbo cancer” doesn’t exist ([click here](#)). In his article, he also doesn’t provide any explanation for these shocking cases, and his entire argument rests on a series of faulty assumptions on what the spike protein mRNA can or cannot do.

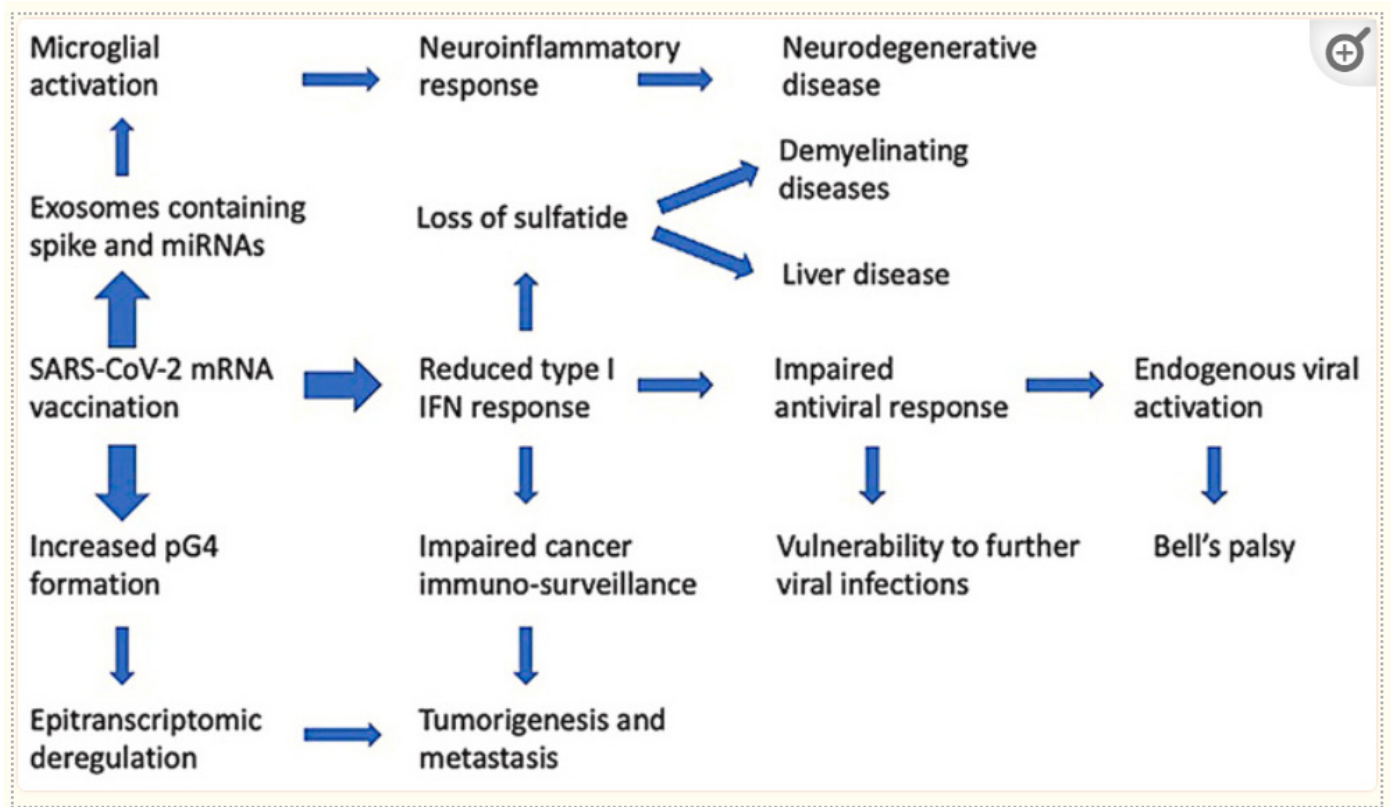

The effects of COVID-19 vaccines on the immune system are extremely complex and not fully understood. However, based on several studies I can best summarize it like this:

COVID-19 vaccines “reprogram” the immune system ([click here](#)). This reprogramming alters the normal communication between immune system cells (production of certain cytokines), and it also alters the function and activity of certain immune cells.

As the authors of another study noted ([click here](#)):

“...revealed dramatic alterations in gene expression of almost all immune cells after vaccination”

MIT scientist Stephanie Seneff and Texas Cardiologist Dr.Peter McCullough wrote an article titled “**Innate Immune Suppression by SARS-CoV-2 mRNA vaccinations**” ([click here](#)) which describes complex mechanisms by which mRNA vaccines impair immune system signaling, **leading to innate immune suppression:**

There is also a study that suggests that SARS-CoV-2 spike protein strongly interacts with tumor suppressor proteins **p53 and BRCA-1/2**, potentially turning them off ([click here](#)):

“p53 and BRCA are the well-known tumor suppressor proteins, that regulate downstream genes in response to numerous cellular stress and are frequently mutated in human cancer”

In some people, this immune system “reprogramming” or innate immune system suppression leads to a **complete loss of protection** against cancer cells arising and spreading rapidly.

Recently, on the “Ask Dr. Drew” show, US pathologist Dr. Ryan Cole showed evidence of the extensive presence of spike protein in lymphoma tumors ([view here](#)).

Needless to say, COVID-19 mRNA vaccine spike protein should not be found in malignant tumours.

There are many anecdotal reports on twitter from people who describe “turbo cancers” suffered by their family members following COVID-19 vaccination. Most of these seem honest enough to take seriously, but it is clear that doctors are not taking these cases seriously enough.

Robaroo @WayneRo63207482 · Feb 11

Frightening as **turbo cancers** are here. My best man at my wedding, super fit healthy. Back Pain. Opened him up and had stage 4 **cancer**. Dead in weeks. Starts in every major organ at once. Pathologist Dr Ryan Cole explains.

This happened to a friend of mine. **Turbo cancer**. It literally was 5 weeks from diagnoses to death.

JoPatWar @JoPatWar · Feb 15

My friend only realised her terminal **turbo cancer** might be from the v when she was too ill to report. Of course her oncologist didn't either. I'm so angry. Teen **cancer** cured then **cancer** free for over 50 years... to be dead within a few months. 🤬

I'm 100% convinced my step mother experienced all of this. She suffered accelerated/**Turbo** stage 4 **cancer** after receiving the 1st vaccine back January 2021. She was diagnosed with stage 4 **cancer** in March and passed on September 15 2021. Constant issues with clotting and bleeding.

Sorry for your loss. My family experienced the exact t same last August. My uncle who's **cancer** was in remission for almost 4 years took 3 as far as we know. Possibly 4 but didn't tell us because he knew our stance. Got a call from the hospital, **turbo cancer** hit, gone in 2 weeks.

And another friend's wife got **turbo cancer** after her second jab, the doctors told her no need for chemo and gave her 6 months to live, she died after two. There are others in my circle which have died but in those cases it's unclear what's the causes

Many of us want justice for our family members dead and injured. My dad died of **turbo cancer**. Stage 4 **cancer** 2 months after booster and died within 9 months of diagnosis. My 18 year old didn't listen and has heart issues with a resting heart rate now of 110.

Nanna Flamingo @fraggleflamingo · Feb 17

I haven't been sick at all this winter, but most people I know (all jabbed) have been sick for weeks and now my uncle has **turbo cancer**, not expected to last long 🙄 he's been massively healthy conscious and fit all his life but he went and took those fucking injections 🚫💉

Many obituaries now talk about a "brief but courageous battle with cancer". We need more autopsies with immunohistochemical staining for the spike protein in cases of rapidly progressing cancer, but we will not be getting them anytime soon. Certainly not in Canada.

So far, doctors are not taking this issue seriously, and by the time they do, it will be far too late for many, and we may have a full blown healthcare catastrophe on our hands.
